

# Testing Challenges in 5G

**Rasikan M**

**Lead Test Architect - Nokia**

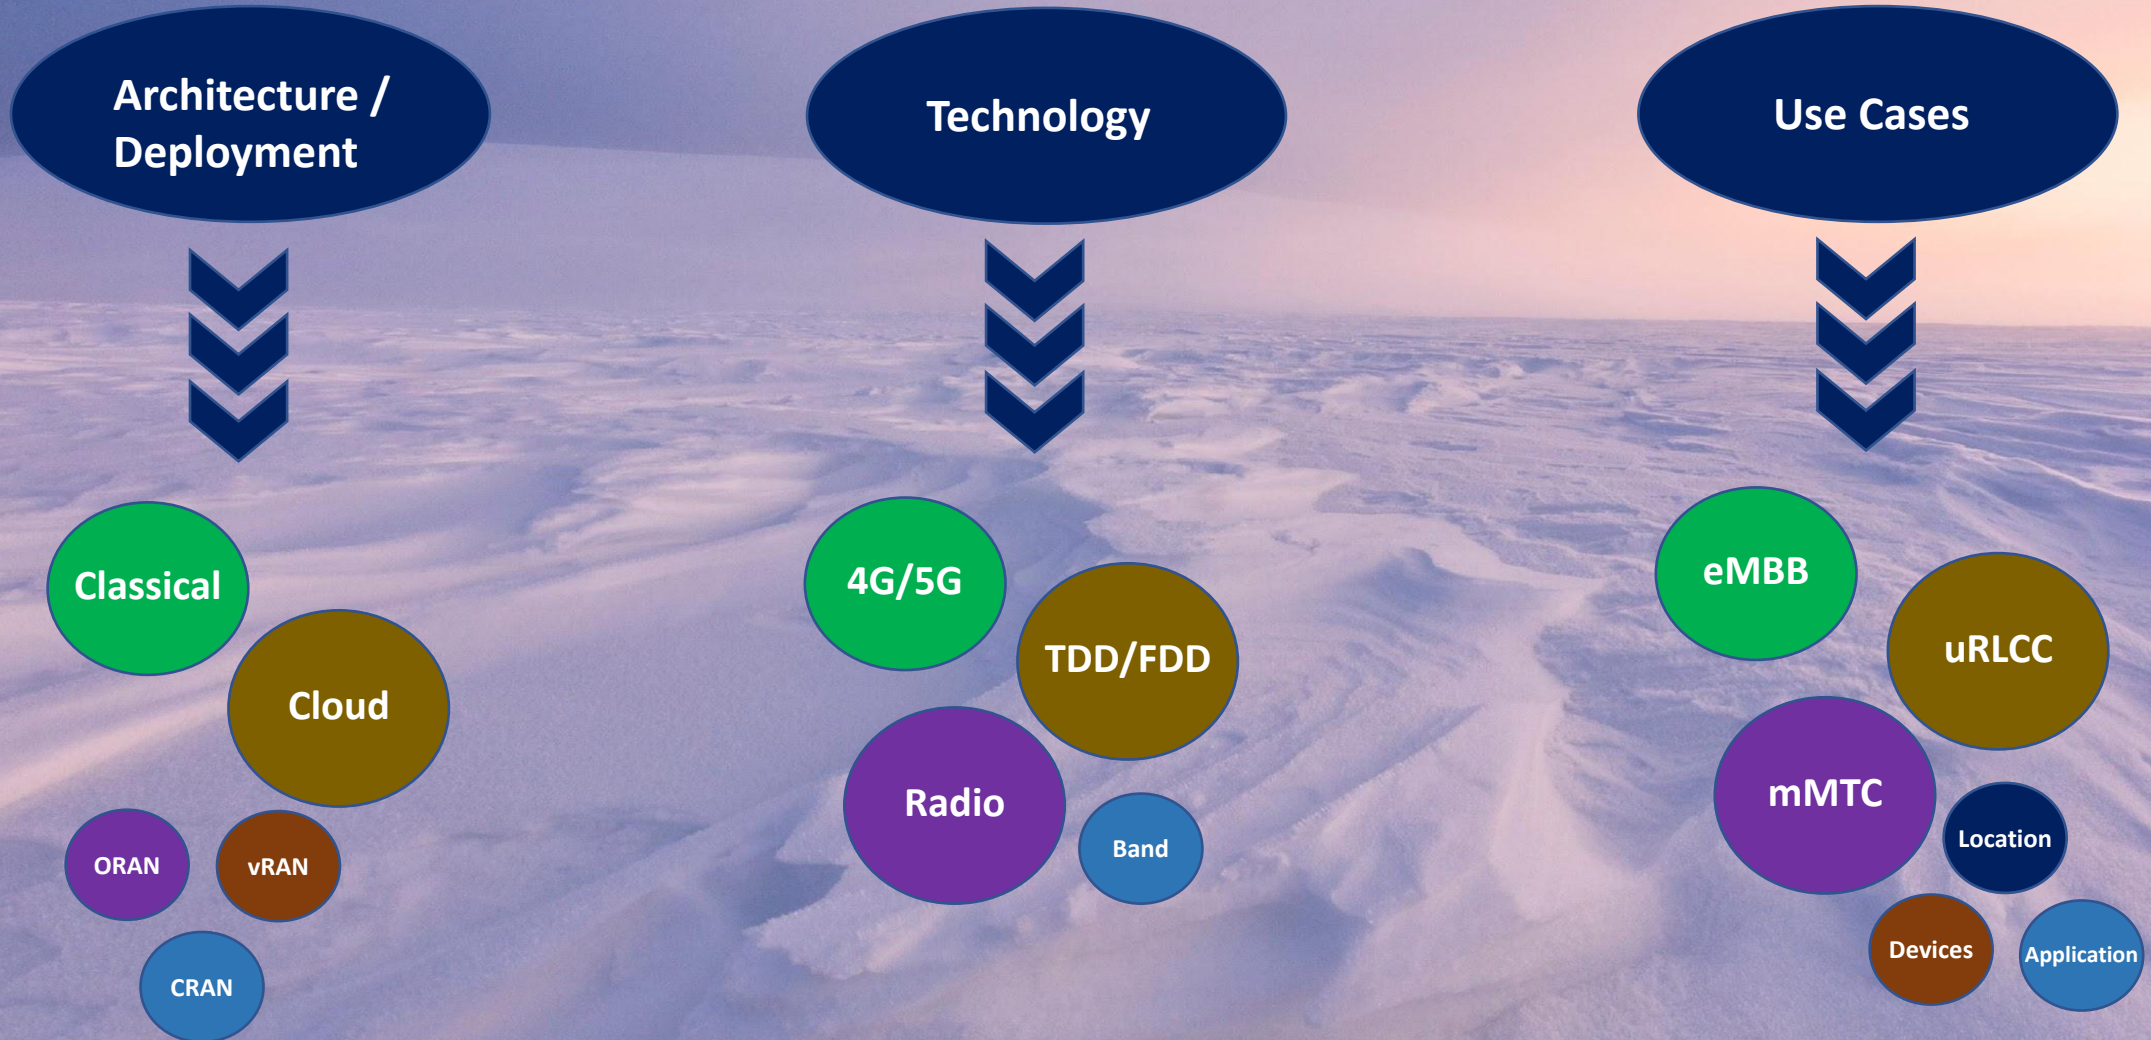

## Note

The contents of this presentation are generic and does not represent details of work done in any specific organization.

Data presented in the slides are indicative values and not a reference to any specific vendor product

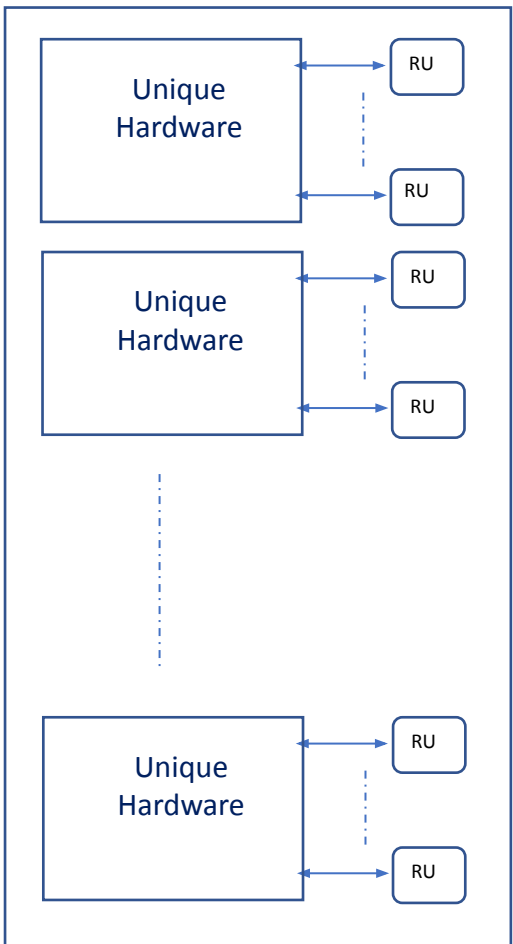

# Radio Access Network

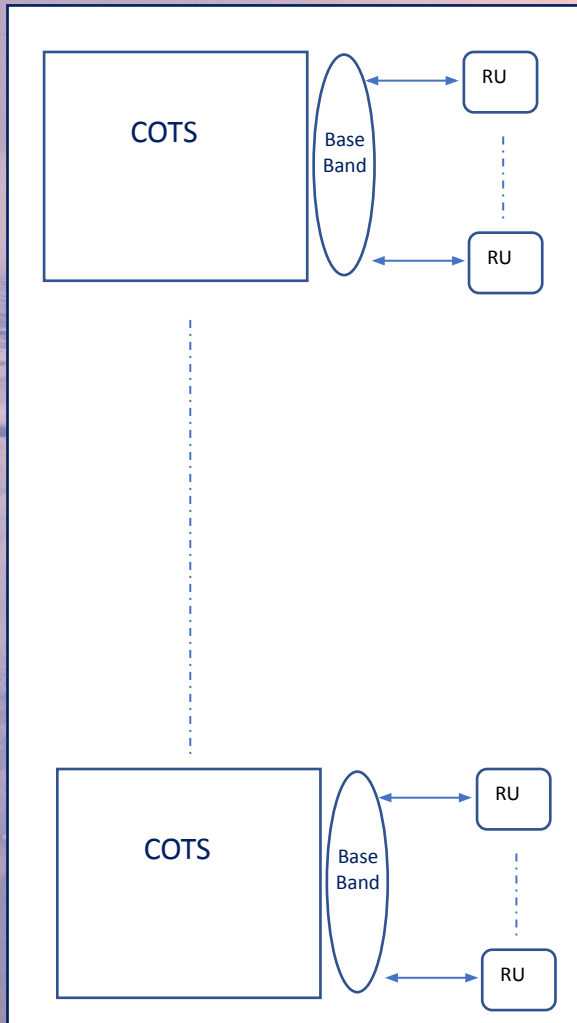

# Architecture/Deployment

## Classical configuration

- Unique & Vendor dependent
  - Single card handling all functions
  - Different cards handling split functions
  - Cards and RU typically from same vendor (exception – ORAN)
  - Limited capacity (# cells\* ~ 40 to 60)
  - Limited scalability

## Cloud configuration

- Reduced vendor dependency
  - COTS handling vDU/vCU functions
  - Vendor dependency on
    - Baseband
    - RU(exception – ORAN)
  - Higher capacity (# cells\* > 100 cells)
  - Flexible and scalable

# Challenges

## □ Device ecosystem

Are there options to minimise issues from Customers ?

## □ Multi Cell Configuration

What options are available for testing ?

## □ Use Case

How do I test use cases for Customer deployment ?

## □ ORAN

Integration ?

# Device Ecosystem

Ecosystem supports different variety of devices and interpretation of standards by each vendor can be different

- Mobile vendor interprets a functionality in one way
- RAN vendor interprets same functionality in another way

Question is – Who will adapt to Customer reported problems ?

## Solution

- Testing with devices of different vendors
- Creation of automated test environment with mix of devices
- Test environment need to be flexible to keep plugging in and removing devices as new variants enter market

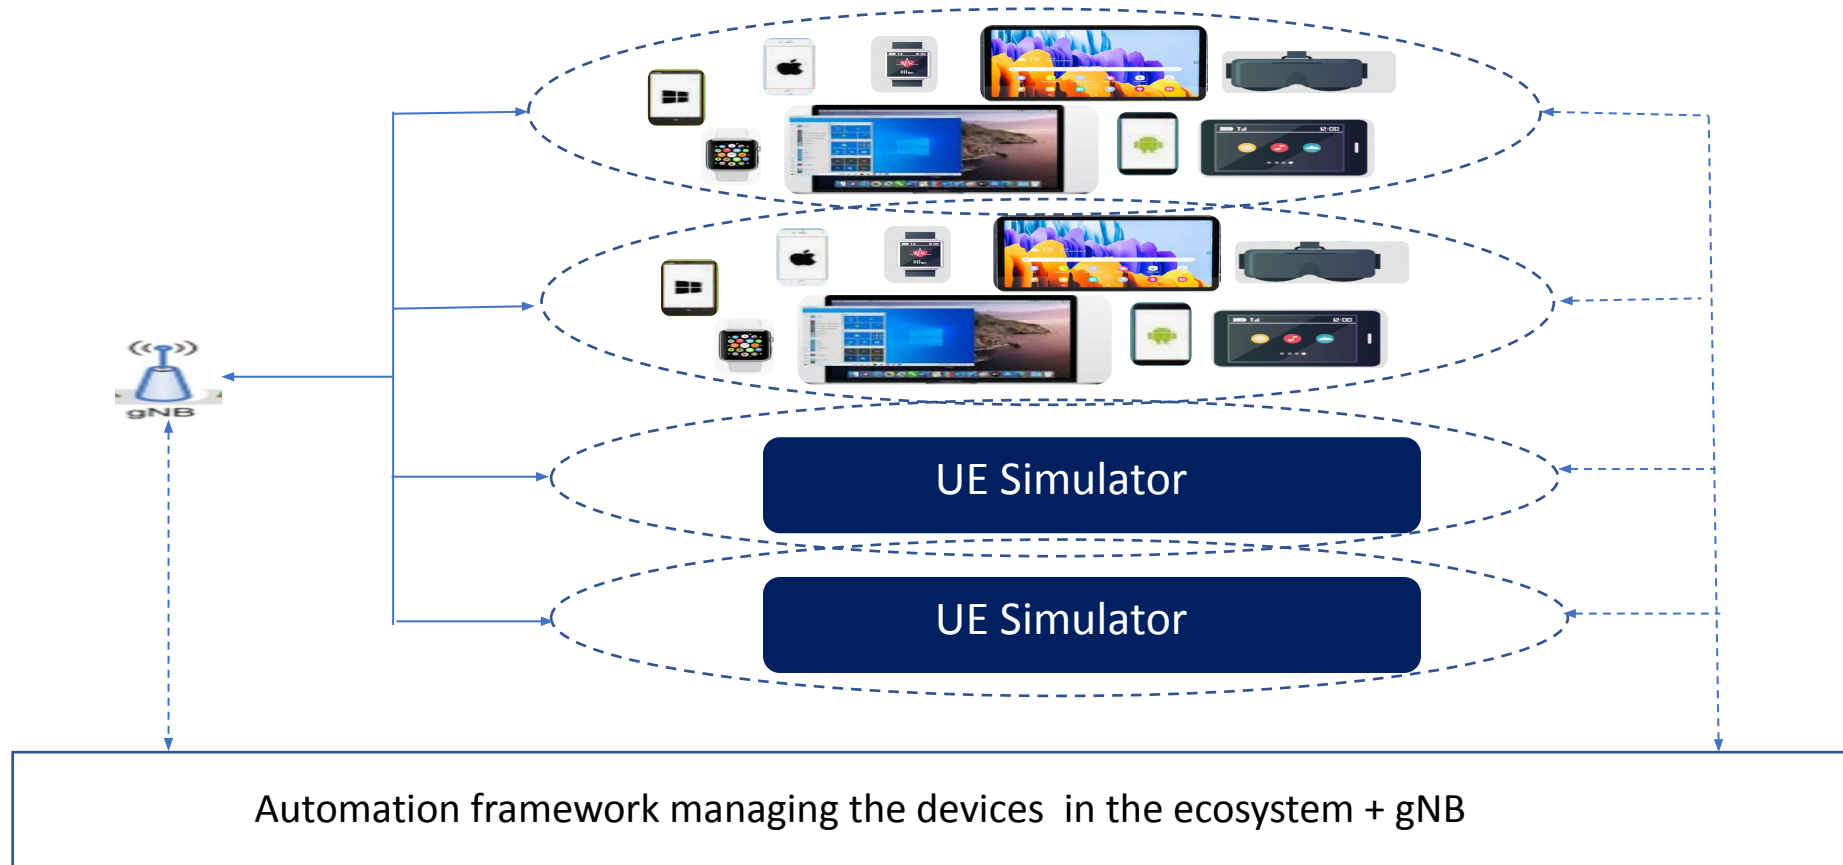

Different profiles can be created to cover different scenario's

# Device Ecosystem

Why are unique issues observed at Customer location but not in lab?

- Load gNB with mix of real UE's and UE simulator

# Multi Cell Configuration

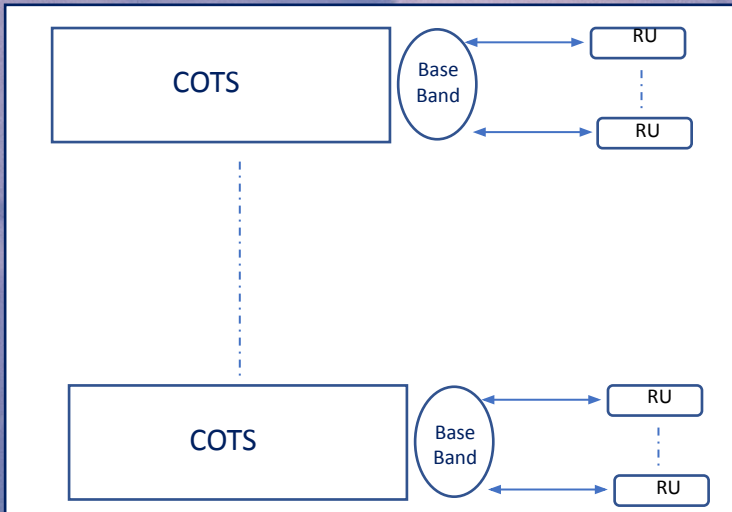

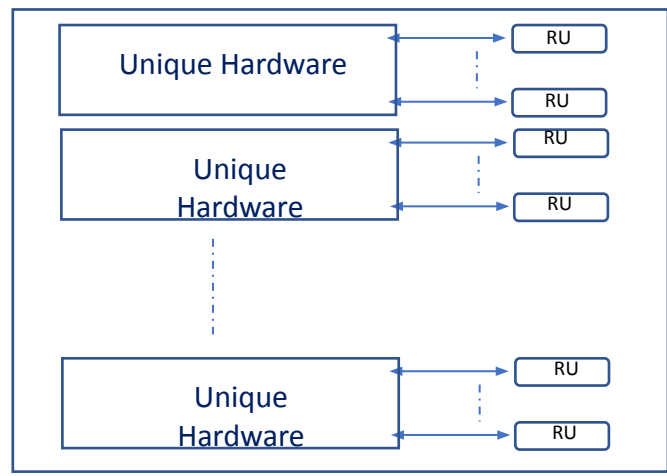

## Challenge

- Replicate the multi cell configuration on multiple setups in lab.

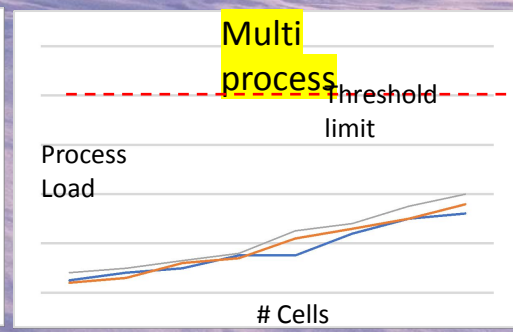

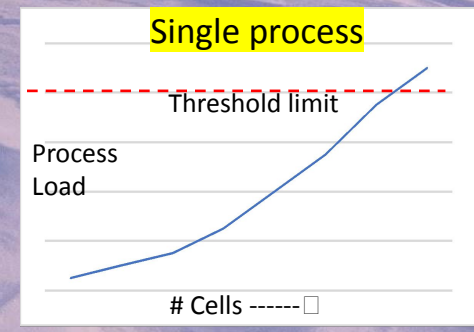

Need for Virtualised Radio clusters – Minimise # Physical RU's

- Classical Configuration**  
# Cells ~ 40 to 60 cells \*  
# RU ~ 20 to 30 \*

- Cloud Configuration**  
# Cells ~ >100 cells \*  
# RU ~ >50 \*

## Architecture & design

O&M

SLM

CM/P  
M

Load

# Use Cases

Challenge – Testing the right mix of call and traffic pattern

## Applications

## Devices

## Deployment Location

# Use Cases

Challenge – Testing the right mix of call and traffic pattern

Packet Size

Burst Rate

QoS

Device Density

CPU

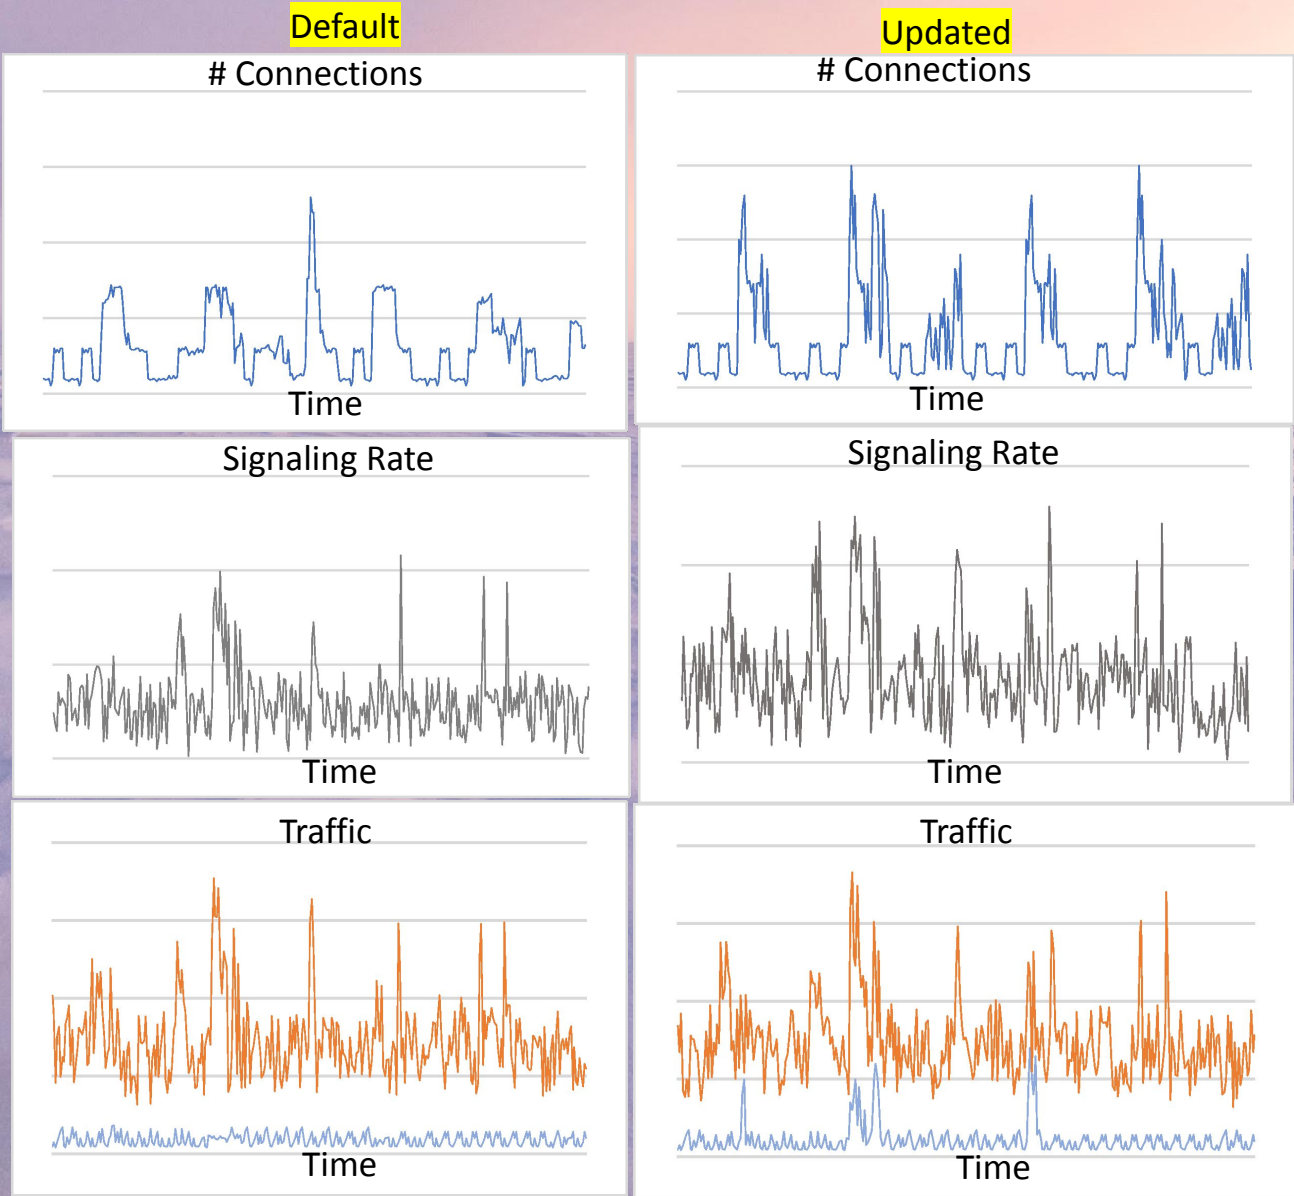

Data Throughput

# Use Cases

## Challenge – Testing the right mix of call and traffic pattern

- 1 Default Traffic Model(s) defined
- 2 System capability to handle the defined traffic model is verified
- 3 System deployed in Customer location
- 4 Statistics collection from deployed network
- 5 Update Traffic model(s), define new traffic models

# ORAN

ORAN allows operators to build networks using best in class network elements from a mix of vendors
